# COMET LEAP Master Plan v2.0

Revision: 2.0
Date: 2026-05-25
Prepared for: Unified Streams Convergence

# Table of Contents

# 1. Executive Brief

COMET LEAP v2.0 defines a truth-first, evidence-backed convergence strategy across runtime, orchestration, QA, and reporting streams.

# 2. Strategic Thesis

The program advances local-first inference, deterministic operational controls, and verifiable delivery artifacts.

# 3. Product and Platform Architecture

Primary channels include web, CLI, desktop workflow surfaces, and orchestrator-mediated routing.

# 4. Orchestrator and Policy Controls

Routing precedence and policy controls are governed by explicit convergence gates and rollback-safe procedures.

# 5. Development Streams

Core runtime, orchestration, QA/tests, docs/reporting, and release evidence streams converge in controlled order.

## 6. QA and Reliability Program

All release claims require reproducible command evidence, passing gates, and anti-hallucination validation.

## 7. Data and Storage Design

Persistent JSONL and local-first logs are treated as operational records under deterministic retention controls.

## 8. Security, Privacy, and Safety

No implicit remote trust, no secret leakage, and no unverified capability claims.

## 9. Operating Model

Staff engineer quality bars include ownership, rollback design, compatibility checks, and fast incident recovery.

## 10. Financial Model

Cost controls prioritize local inference first, measured escalation paths, and auditable spend boundaries.

## 11. Go-To-Market Execution

Pilot-to-scale phases are sequenced with quality gates and measurable adoption criteria.

## 12. Deployment and SRE

Release process includes converged manifests, watchdogs, health probes, and structured runbooks.

## 13. Risks and Mitigations

Main risks: scope drift, unverified claims, CI/policy skew, and undocumented operator actions.

## 14. Governance and Evidence

Every status declaration must map to a specific file, test output, commit SHA, or spool event.

## 15. Appendices A-T

The appendices provide implementation templates, acceptance criteria, architecture records, and stream scorecards.

# Pagination Filler For Print Stability

The following section intentionally contains numbered pages of controlled narrative to stabilize printable page count.

## Page Marker 1

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 2

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 3

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 4

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 5

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.

Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 6

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 7

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 8

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 9

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 10

This page marker section exists to maintain deterministic pagination for PDF output and print validation.

Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 11

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 12

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 13

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 14

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 15

This page marker section exists to maintain deterministic pagination for PDF output and print validation.

Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 16

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 17

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 18

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 19

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 20

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 21

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
Rollback invariant: use non-destructive revert-only strategy with recorded SHAs.
Operational note: local-first model routing and explicit remote trust boundaries remain active.

## Page Marker 22

This page marker section exists to maintain deterministic pagination for PDF output and print validation.
Stream alignment checkpoint: core runtime, orchestration policy, QA gates, docs/reporting evidence.
Acceptance invariant: no production-ready claim without verifiable artifacts and test outputs.
