

Lantern OS — Founder Report: Post-Convergence OSS Funding Edition

Author: Alex Place
Date: 2026-05-28
Status: Post-convergence, seeking open-source sponsorship and community support

WHO I AM

Solo founder. One person building the entire stack: local-first operating system, multi-agent AI orchestration fleet, evidence-gated convergence architecture, Bayesian world models, and open-source tooling — all from a garage PC in Ohio.

No team. No funding. No VC. Just receipts.

WHAT LANTERN OS IS

Lantern OS is a local-first control plane for AI-assisted work. It gives a solo operator:

- **Agent Fleet Orchestration** — route work across multiple AI providers (Gemini, Codex, GPT, Claude) in parallel with worktree isolation, task queues, claim deconfliction, and token budgeting
- **RAG Memory System** — flat-file evidence-labeled memory with source tracking, intake forms, and dollhouse architecture
- **Arc Reactor Governance** — 12-step convergence model with evidence gates, confidence scoring, and promotion rules
- **Local Dashboard** — real-time cockpit showing power state, wallet, boot readiness, fleet status, HFF scores, and operator chat
- **Human Flourishing Framework** — Bayesian world model across 4 domains (humans, animals, ecosystems, universe) with 62+ beliefs and 9 sensors

Everything runs locally. No cloud dependency. No subscription lock-in. The operator owns the data, the process, and the output.

WHAT'S BEEN BUILT (CONVERGENCE EVIDENCE)

System	State	Evidence
Lantern Garage (localhost:4177)	Running	Node.js server, 15+ API endpoints, Claude Desktop chat UX
Agent Fleet	5 slots ready, 10 tasks queued	MCP orchestrator at 127.0.0.1:8787, live dispatch
RAG Dollhouse	4 sources, 108 records	Flat-file + JSONL persistence, source-labeled
Arc Reactor	Movie 1: 88%, Movie 2: 54%	12-step convergence model validated
HFF Scores	H:54% A:43% E:52% U:50%	62 beliefs, 9 sensors, 8 domains
Founder Reports	30+ generated	Multiple formats: dark, print, BW, WCAG
Dual-Boot Prep	8 pass, 4 warn, 0 fail	Ready for NixOS install (operator-held)
Wallet	\$0 cleared, \$199 draft invoice	Clean factual ledger, no fake revenue
Git History	228+ PRs merged	Continuous integration across repos
Patent Candidates	5 identified	Internal drafting, evidence-linked

WHY OSS FUNDING

This project is open source because the tools should belong to the people who use them. But building solo costs real money:

- **AI API tokens** — running a fleet of agents burns through credits fast
- **Hardware** — one PC doing everything (orchestration, builds, PDF generation, local models)
- **Time** — full-time solo effort with no salary
- **Infrastructure** — domains, hosting, CI/CD, storage

I'm not asking for investment. I'm asking for support from people who believe local-first, evidence-gated, human-centered AI tooling should exist and be free.

HOW TO SUPPORT

GitHub Sponsors

The most direct way. GitHub may match contributions for eligible projects.

github.com/sponsors/alex-place

Ko-fi

One-time or monthly support, no platform cut on donations.

ko-fi.com/alexplace

Direct Pilot Purchase

Buy a real deliverable:

- **Local RAG / Repo Cleanup Sprint** — \$199-\$499 — I take your messy folder/repo/PDF set and turn it into a clean evidence-backed packet
- **Founder Report Pack** — \$149-\$299 — convergence report with evidence classes for your project
- **School/Family Creative Learning Packet** — \$49-\$149 — art/game/learning materials

Itch.io (Coming)

Downloadable packets, tools, and demos. Free tier + paid tier.

Open Collective (Planned)

Transparent community funding with public ledger.

WHAT SPONSORS GET

Tier	Amount	Deliverable
Spark	\$5/mo	Name in SUPPORTERS.md, early access to reports
Lantern	\$15/mo	Monthly founder update, priority issue response
Reactor	\$50/mo	Direct chat access, custom report generation, RAG cleanup credits
Arc	\$100/mo	All above + patent candidate review access, named in whitepaper
Avenger	\$500/mo	Strategic collaboration, co-development sessions, dedicated agent slot

WHAT'S NEXT

Immediate (This Week)

- 1. Set up GitHub Sponsors profile with tier descriptions
- 2. Set up Ko-fi page with project description
- 3. Publish this report as the public funding announcement
- 4. Send outreach to 5 warm contacts with pilot offer

Short Term (2 Weeks)

- 1. First Itch.io page with downloadable Lantern OS packet
- 2. First public demo/screenshot set
- 3. Discord community launch with operator/supporter roles
- 4. Weekly founder update cadence established

Medium Term (4 Weeks)

- 1. Open Collective setup with transparent budget
- 2. First paid pilot completed and testimonial captured
- 3. v1.0 release candidate with clean packaging
- 4. Store Release Lanes activated (Itch → GitHub Releases → eventual Steam)

THE REAL PITCH

I built a multi-agent AI orchestration fleet, a Bayesian world model, a local-first operating system, a convergence governance architecture, and 30+ evidence-gated reports — solo, from a garage PC, with no funding.

I also built a gentle healing report for my mom with waterfall and peacock symbols because she has things she wants to say but doesn't know how to sum them all up.

The same system that dispatches AI agents in parallel also knows that a blank space is not a failure and that the first win is a warm reconnect.

That's the kind of technology I want to exist in the world. If you do too, sponsor the work.
