

Lantern OS All-Repos Code Master Plan

Date: 2026-05-26

Control repo: alex-place/lantern-os

Branch written: master

Mode: connector inventory, code-first, all accessible repositories

Scope correction: this supersedes the earlier Lantern-only RAG-house plan.

CORRECTION

The previous report was too narrow. It treated alex-place/lantern-os as the whole universe. That is wrong for an all-code master plan. This report treats Lantern OS as the control plane and covers every repository currently visible through the GitHub connector inventory. Connector inventory returned 43 accessible repositories and a second page returned no additional repositories.

OPERATING GOAL

Build one master control plane for all code without destroying working repo history.

The desired state is:

- 1. Every repo is represented in a Lantern OS inventory.
- 2. Every code surface is classified by runtime, language, risk, and promotion path.
- 3. Active repos are pulled into RAG as indexed metadata first, not blindly copied source.
- 4. Code stays executable in its source repo unless explicitly promoted.
- 5. Lantern OS stores the map, receipts, launch paths, validation status, and migration decisions.
- 6. All future moves happen as small commits with validation receipts.

REPO INVENTORY SUMMARY

Total accessible repositories: 43

Visibility split from connector metadata:

- Public: 31
- Private: 12

Default branch split:

- master: 36
- main: 7

Search index status from connector metadata:

- Indexed: 16
- Not indexed: 27

ALL REPOSITORIES

#	Repository	Visibility	Default branch	Size KB	Search indexed	Primary code lane
1	alex-place/Mr.Nom	public	master	680	no	game/app legacy

CODE-FIRST REPO LANES

Lane A - Active control and agent runtime

Repos:

- alex-place/lantern-os

- alex-place/gm-agent-orchestrator
- alex-place/gamemaker-room-editor
- alex-place/lantern-symbolic-sandbox

Purpose:

- These are the current operating spine.
- Treat these as the first repos to inspect locally before any automation or mass refactor.
- They likely control MCP, orchestration, GameMaker workflows, RAG intake, and Lantern control-plane behavior.

Promotion path:

- 1. Inspect local dirty state first.
- 2. Map commands, scripts, configs, and agent queues.
- 3. Add validation receipts to lantern-os/manifests/validation/.
- 4. Only then index code into references/LANTERN-OS-RAG-DOLLHOUSE.flat.md.

Lane B - Business/service apps

Repos:

- alex-place/moneybags
- alex-place/SmartBid
- alex-place/place_co
- alex-place/smartmealplanning
- alex-place/statusmonitor
- alex-place/intspeedcheck
- alex-place/badslotserver
- alex-place/slothapi
- alex-place/server-debugclient
- alex-place/Cloudbot
- alex-place/corporate_crawler
- alex-place/clouddataissexy

Purpose:

- Revenue, service, automation, monitoring, crawler, and API surfaces.
- These need dependency, secrets, env, endpoint, and test mapping before migration.

Promotion path:

- 1. Build manifests/ALL-REPOS-CODE-SURFACES.md entries.
- 2. For each repo, capture run command, build command, test command, deploy target, and secrets state.
- 3. Mark repos with unknown secrets as held until reviewed.
- 4. Do not combine services until ports, env files, and database assumptions are known.

Lane C - Game/app legacy code

Repos:

- alex-place/Mr.Nom
- alex-place/Returners
- alex-place/Quest
- alex-place/GDungeon
- alex-place/GDXJam
- alex-place/GdxJam2
- alex-place/Orion
- alex-place/Porkopolis
- alex-place/Dungeon
- alex-place/MysticGarden
- alex-place/ChildOfLevistus

- alex-place/BadSloth

Purpose:

- Legacy games, experiments, app/game clients, and large art/content projects.
- Treat these as preservation plus selective modernization, not blanket rewrite.

Promotion path:

1. Identify engine/runtime per repo.
2. Capture build toolchain and asset requirements.
3. Preserve binary/art assets separately from source summaries.
4. Index source architecture and key loops into RAG; do not dump all assets into Lantern OS.

Lane D - Java/API/library code

Repos:

- alex-place/jriot
- alex-place/riot-api-java
- alex-place/LoL-Chat
- alex-place/libgdx

Purpose:

- Java/API/library ecosystem.
- libgdx is very large and likely should not be absorbed directly into Lantern OS.

Promotion path:

1. Treat libgdx as external/vendor-sized unless a specific fork delta is needed.
2. Index only local modifications and dependency role.
3. For Riot API repos, inspect whether API contracts are current before any rebuild.

Lane E - Sites/content/frameworks

Repos:

- alex-place/TheGiddyLimit.github.io
- alex-place/alex-place.github.io
- alex-place/alex-place..github.io
- alex-place/dnd_homebrew
- human-flourishing-frameworks/human-flourishing-frameworks
- human-flourishing-frameworks/.github

Purpose:

- Sites, content systems, framework documents, and org-level config.

Promotion path:

1. Separate copyright/content assets from source code.
2. Index metadata and local authored docs first.
3. Copy only operator-owned or approved assets into Lantern OS.
4. Use summaries and manifests for large public-content repos.

Lane F - Empty/placeholders

Repos:

- alex-place/VisionPark
- alex-place/tradiest
- human-flourishing-frameworks/.github

Purpose:

- Placeholder or nearly-empty control points.

Promotion path:

- Mark as held or archive_candidate until the operator assigns purpose.

REQUIRED LANTERN OS FILES

Add or update these files in alex-place/lantern-os:

```
manifests/ALL-REPOS-INVENTORY.md
manifests/ALL-REPOS-CODE-SURFACES.md
manifests/ALL-REPOS-RAG-INTAKE.md
manifests/ALL-REPOS-VALIDATION-MATRIX.md
references/LANTERN-ALL-REPOS-CODE-RAG.flat.md
reports/LANTERN-OS-ALL-REPOS-CODE-MASTER-PLAN-2026-05-26.md
```

PER-REPO INTAKE RECORD

Every repo needs this record before code is moved, rewritten, or promoted:

```
repo:
visibility:
default_branch:
local_path:
local_status:
remote_status:
primary_language:
runtime:
entrypoints:
build_command:
test_command:
validation_receipt:
secrets_or_env:
asset_weight:
rag_state:
promotion_decision:
next_action:
```

VALIDATION RULES

Do not push mass rewrites across all repos. Use staged validation:

- 1. Inventory only.
- 2. Read-only local clone/status check.
- 3. Build/test command discovery.
- 4. One repo, one small change, one commit.
- 5. Push only after validation evidence is captured.
- 6. Update Lantern OS manifests after each repo pass.

PRIORITY ORDER

Recommended first pass:

- 1. alex-place/gm-agent-orchestrator - controls agents and MCP workflow.
- 2. alex-place/gamemaker-room-editor - current GameMaker tooling.
- 3. alex-place/lantern-symbolic-sandbox - RAG/symbolic experiments.
- 4. alex-place/moneybags - indexed, large public app/business code.
- 5. alex-place/place_co - company/site surface.
- 6. human-flourishing-frameworks/human-flourishing-frameworks - framework/control content.
- 7. alex-place/ChildOfLevistus - large private game/content project.
- 8. alex-place/TheGiddyLimit.github.io - very large content/site repo; metadata-first only.
- 9. Legacy game repos as preservation lane.
- 10. Placeholder repos last.

RISKS

- 1. Some repos are very large and should not be copied into Lantern OS.
- 2. Some repos are not search indexed, so connector metadata is incomplete.
- 3. Private service repos may contain environment assumptions or secrets paths; inspect before action.
- 4. Game repos may have binary assets that should be manifested, not embedded.
- 5. `libgdx` and `TheGiddyLimit.github.io` are large enough to require metadata-first handling.
- 6. The connector cannot validate local dirty worktrees; local status must override remote assumptions.

DONE DEFINITION

This corrected all-repos plan is complete when:

- This report exists on master in `alex-place/lantern-os`.
- The PDF report is generated from this content.
- `manifests/ALL-REPOS-INVENTORY.md` exists.
- `manifests/ALL-REPOS-CODE-SURFACES.md` exists.
- Every repo has an intake state.
- Active code repos have `build/test/launch` commands captured.
- No repo is rewritten or moved without validation evidence.

NEXT SAFE COMMIT

Create `manifests/ALL-REPOS-INVENTORY.md` from this connector inventory, then begin read-only local inspections for the active control lane.
