

Lantern OS v1.0.0 Readiness Test

Generated: 2026-05-26.

Repo: <https://github.com/alex-place/lantern-os>

VERDICT

Status: not_v1_yet

Confidence: 74/100

Lantern OS is action-ready and garage-ready, but not release-final. The repo has crossed out of skeleton mode. It still needs operator approval, one real cash result or objection batch, and dual-boot physical prep before a true v1.0.0 tag.

GATE RESULTS

Gate	Status	Evidence	Next Action
Repo Cleanliness	pass	master...origin/master; source repos clean in loop	keep small commits
Windows Surface	pass	shareholder index, Tony Garage, Windows setup script	optionally rerun Windows setup
NixOS / Dual Boot	candidate	prep-ready; install-held; D: shrink needed	run elevated prep and shrink D: manually
COMET LEAP 30-Day Model	pass/candidate	artifacts, PDFs, images, reports exist	operator review claims
Capability Honesty	pass	ADS, whitepaper, blocker-fix records	keep boundaries visible
Release Approval	hold	operator has not explicitly said promote to v1.0.0	wait for explicit approval
Old Surface Retirement	pass/candidate	old Seven retired, old workstreams mapped	keep retiring conflicts
Loop Evidence	pass	convergence loop issueCount=0	save each major run
Dream Works	candidate/pass	Tony Garage creates first-screen cockpit	open cockpit and run cash/dual-boot actions
Store Lane	candidate	local garage store now; Itch next; Steam/GOG later	ship local/Itch before paid or curated stores

RELEASE BLOCKERS

- 1. No explicit operator approval for v1.0.0 tag.
- 2. Cleared cash is still \$0; outreach is send-ready, not proven.
- 3. Dual boot install is held until D: has 100-250GB unallocated space.
- 4. Store target is now ordered, but no Itch/GOG/Steam product page is live yet.

MOVIE CONFIDENCE

Phase	Current Confidence	Meaning
Movie 1 garage	88	working cockpit, artifacts, local memory, action loop
Movie 2 public platform	54	needs cash proof, install proof, store lane, repeatable users

Phase	Current Confidence	Meaning
Movie 3 fleet	22	needs multiple devices/nodes, automation, users, recovery evidence

DECISION

Do not tag v1.0.0 yet. Use the Tony Garage cockpit to run the next proof loop:

```
send -> record -> shrink/prep -> rerun -> update RAG -> decide
```

Store proof loop:

```
local garage store -> Itch prototype -> feedback/downloads -> then Steam/GOG
```
