

Alex's Work Summary - May 2026

For Mom

What I've Been Working On

I've been building something called "Lantern OS" - it's a computer system that helps people work together better, stay safe online, and make good decisions. Think of it like a really smart helper that lives on your computer.

The Big Picture (Layman's Terms)

Main Things I Built:

1. ****A Safety System**** - Like having a careful friend who checks if something is safe before you do it. It helps prevent mistakes and keeps people from doing things they shouldn't.
2. ****A Dashboard**** - Like a control panel where you can see everything that's happening, check if things are working, and make changes safely.
3. ****Communication Tools**** - Ways for computers to talk to each other and share information without letting bad things happen.
4. ****Money and Business Tools**** - Systems to help track money, make payments, and handle business transactions safely.
5. ****Art and Creative Tools**** - Systems to create and share art, music, and other creative work.

What I Fixed (The Problems I Solved)

Computer Setup Problems:

â€¢ Made it easier to set up Windows computers automatically

â€¢ Created guides for installing two operating systems on one computer (called "dual boot")

â€¢ Wrote instructions for fixing things if something goes wrong

Safety and Security:

â€¢ Built systems that check if computer actions are safe before they happen

â€¢ Created ways to prove that software hasn't been tampered with

â€¢ Made systems that help people work together without trusting each other completely

Website and Online Tools:

â€¢ Fixed problems with how the website handles different users

â€¢ Made sure the dashboard shows the right information to the right people

â€¢ Created systems that check if the website is working properly

Documentation and Guides:

- â€¢ Wrote lots of instructions so other people can understand what I built
- â€¢ Created guides for how to use different parts of the system
- â€¢ Made checklists for doing complex tasks safely

Testing and Quality:

- â€¢ Built systems that automatically test if everything is working
- â€¢ Created ways to find problems before they cause real trouble
- â€¢ Made sure changes don't break things that were already working

The Numbers (How Much I Did)

- â€¢ ****Over 60 different problems fixed**** across all areas
- â€¢ ****Multiple complete systems built**** from scratch
- â€¢ ****Dozens of guides and documents written****
- â€¢ ****Several automated testing systems created****
- â€¢ ****Multiple creative tools and art systems made****

What This Means in Real Life

For Regular People:

- â€¢ Safer computer use
- â€¢ Easier to understand what's happening
- â€¢ Better tools for working together
- â€¢ Less chance of making mistakes

For Businesses:

- â€¢ Safer money handling
- â€¢ Better tracking of what's happening
- â€¢ Easier to prove things are working correctly
- â€¢ Less risk of problems

For Creative People:

- â€¢ Better tools for making art
- â€¢ Safer ways to share creative work
- â€¢ Easier to organize creative projects

What's Still Waiting (Things That Need Physical Action)

Some things I can't do just with code - they need someone to actually touch the computer:

1. ****Dual Boot Installation**** - Needs someone to actually install the second operating system on a real computer
2. ****Fleet of Helper Programs**** - Need to prove that many helper programs are actually running at the same time

How I Make Sure Things Work

I use something called a "convergence loop" - it's like a checklist I run through to make sure:

- â€¢ Everything is documented
- â€¢ Problems are fixed before adding new things
- â€¢ Old stuff is either updated or clearly marked as outdated
- â€¢ There are ways to undo changes if something goes wrong
- â€¢ Safety checks are in place

The End Result

I've built a complete system that:

- â€¢ Helps people work together safely
- â€¢ Makes it harder to make mistakes
- â€¢ Provides tools for creativity and business
- â€¢ Has lots of documentation so others can use it
- â€¢ Is tested automatically to catch problems

It's like building a really well-organized house where everything has its place, there are clear instructions for how to use everything, and safety features are built in from the start.

What I'm Most Proud Of

1. ****The Safety Systems**** - Making sure people can't accidentally do dangerous things
2. ****The Documentation**** - Writing clear instructions so others can understand and use what I built
3. ****The Testing**** - Making sure things actually work before saying they're done
4. ****The Dashboard**** - Creating a place where people can see and control everything easily
5. ****The Creative Tools**** - Building systems that help people make and share art

In Simple Terms

I spent a lot of time building a computer system that:

- Keeps people safe

- Helps them work together

- Makes it easy to see what's happening

- Has clear instructions

- Is tested to make sure it works

It's like being an architect, safety inspector, and teacher all at the same time - designing the building, checking it's safe, and teaching people how to use it.
