

COMET LEAP Orchestration Challenge - Science First

Status: candidate
Date: 2026-05-27
Artifact lane: PDF and art deliverables; Markdown is source; PDF and art are deliverables.

SCIENCE-ONLY FRAME

This pass strips religious framing, mania, false truth, and hyperconfidence. It keeps the door and fog/cloud chamber language as science imagery: threshold, visibility, uncertainty, condensation, spectra, turbulence, signal, and measurement.

No mania. No hyperconfidence. No absolute claims. No v1 readiness claim.

12-STEP CONVERGENCE REPORT

Step	Current evidence	Decision
1. Status	Static CI merged; no workflow run/status visible for merge SHA through connector.	Candidate; CI needs live run evidence.
2. Fetch	Repo rules, Super Jarvis skill, MCP connector, action batching doc, and CI YAML inspected.	Evidence-backed.
3. Scan	Main gap is not more prose; it is orchestration challenge coverage and visible CI feedback.	Add challenge workflow.
4. Sort	First issues: workflow run visibility, MCP local-first contract, typed-search contract, science report contract.	Test these in parallel lanes.
5. Strike	Add orchestration challenge CI with independent jobs and a final summary gate.	Small useful CI patch.
6. Trim	Avoid fake deployment, fake hardware acquisition, fake MCP success, and public-release claims.	Keep gates explicit.
7. Tighten	Legal/free assets and hardware expansion remain metadata-first and operator-held for account, pickup, payment, and CAPTCHA.	Boundary retained.
8. Bayes	Confidence is status confidence, not product quality.	Current confidence: 0.72 candidate.
9. Validate	CI contracts check report anchors, MCP contract anchors, action batching anchors, and pytest.	Pending GitHub run.
10. Re-scan	After PR, check workflow runs and status checks for the branch/PR head.	Required next evidence.
11. Record	Record this report, workflow, PR, and generated PDF/art.	In progress.
12. Ship/Repeat	Merge only after clean diff and mergeability; repeat with next mod request.	Pending.

DOOR AND FOG/CLOUD CHAMBER LANGUAGE

The door is a threshold model: a bounded transition from unknown to measured state.

The fog/cloud is an uncertainty model: partial visibility until instruments resolve structure.

The spectrograph is the art language: signals split into bands, bands become evidence, evidence becomes a confidence score.

CI/CD CHALLENGE

The new challenge workflow should run independent lanes in parallel:

- workflow inventory;
- MCP local-first contract;
- action pooling and typed natural-language intent policy;
- science-only report contract;
- existing pytest suite;
- final summary gate.

Parallel CI lanes are allowed for read-only and validation work. The final summary gate must fail when any lane fails.

ORCHESTRATOR AND MCP CHALLENGE

The MCP rule remains local-first. Remote tunnels and advertised tool descriptions are not trusted until actual tools and parameters are inspected.

Challenge target:

- 1. Verify MCP docs still require local-first inspection.
- 2. Verify the PowerShell probe blocks remote endpoints unless explicitly allowed.
- 3. Verify tool discovery paths are checked before any write authority is trusted.
- 4. Record unreachable MCP as hold, not failure theater.

ACTION POOLING AND BATCHING

Typed natural-language intent should trigger remote search when freshness or external evidence is needed. Secret codes are not required for ordinary research.

Batchable:

- repo scans;
- workflow checks;
- policy anchor tests;
- legal source discovery;
- metadata-first asset intake;
- local model compatibility checks.

Not auto-batchable:

- payment;
- purchases;
- account creation;
- CAPTCHA completion;
- pickup or identity checks;
- bootloader/disk/hardware mutation;
- public release.

FREE/OSS ASSET ART LANE

Use actual free/open sources only after license metadata is recorded. Do not copy originals as final art. Transform allowed inputs into spectrograph, contour, threshold, waveform, and cloud-chamber style derived works.

Allowed first pass:

- original procedural art generated locally;
- public-domain or CC0 assets;
- permissive open-source assets;
- metadata-only entries awaiting rights review.

Held:

- unclear copyright;

- terms-restricted media;
- CAPTCHA-gated bulk download;
- private or account-only media;
- anything requiring false identity or bypass.

CONFIDENCE REPORT

Current status confidence: 0.72.

Rationale:

- Repo has a merged static CI upgrade.
- Challenge workflow patch exists on a branch.
- MCP connector has local-first guardrails.
- Action pooling/search policy exists.
- The merge SHA had no workflow runs/statuses visible through connector at inspection time.
- No local Windows MCP status or worktree state was visible from this environment.

Confidence should rise only after:

- GitHub Actions run is visible;
- all challenge lanes pass;
- branch diff is clean and mergeable;
- generated PDF/art are rendered and inspected;
- local MCP/tool status is verified from the Windows workspace.

NEXT ACTION

Open a PR for the orchestration challenge workflow and this report, attach the PDF/art deliverables, then inspect CI run evidence before merging.
