

RAGDoll House Reports Update — 2026-05-29

Status: master receipt
Scope: documentation/reporting only

SUMMARY

- This receipt consolidates the new Lantern OS report direction:
- prediction-market statistics receipts;
 - !trade, !spy, and !trade-gamble skill setup;
 - operator-controlled execution adapter boundary;
 - money-validation PR plan;
 - Oracle ARM + Ollama cost-optimized infra plan;
 - rationality / Aumann / Bayesian founder / Supergrok fleet lore intake.

RAGDOLL HOUSE UPDATES

Topic	RAGDoll classification	Notes
Prediction-market statistics	research-only seed	No broker login, no live trade instruction, no profit claim.
Trade gamble product	product setup spec	Supports capped naked long call/put workflow as manual/product architecture.
Execution adapter	architecture spec	Not local-only; operator-controlled deployment can be local, VPS, cloud, CI, container, or broker-supported runtime.
Money validation	PR-gated test harness	Dry-run, paper, live_locked, live_confirm, live_armed, emergency_stop ladder.
Oracle ARM + Ollama	infra cost report	Low-cost model backend for Lantern OS agents and RAG tasks.
Rationality/Supergrok	conceptual lore receipt	Treat as design contract and knowledge model, not proof of live autonomous fleet.

CURRENT BRANCH/PR NOTE

Direct master pushes were used for earlier receipts and skill definitions. The money-validation harness should proceed from a branch and PR. The GitHub connector failed to create the remote branch from chat, so the local workspace should create and push:

```
git fetch origin
git switch -c test/trade-gamble-money-validations origin/master
git push -u origin test/trade-gamble-money-validations
```

After the branch exists, the product files can be added and reviewed through PR.

WINDOWS CURL CORRECTION

PowerShell aliases curl to Invoke-WebRequest, so Linux flags like -fsSL fail. Use one of these instead:

```
curl.exe -fsSL https://raw.githubusercontent.com/alex-place/lantern-os/master/infra/setup-lantern-oracle-arm-full.sh
-o setup.sh
```

Or run the Linux command from SSH on the Oracle ARM Ubuntu server:

```
curl -fsSL https://raw.githubusercontent.com/alex-place/lantern-os/master/infra/setup-lantern-oracle-arm-full.sh |
bash
```

BOUNDARIES

- No credentials in repo, prompts, RAG, PDFs, logs, or screenshots.

- No live broker order from chat.
- No exact live option contract instruction from chat.
- No profitability claim without paper/backtest evidence.
- Product architecture may support operator-controlled adapters under explicit risk gates.

PDF GENERATED

A new human-readable PDF report was generated for validation:
