

Survival and Flourishing Fund (SFF) HSEE Round Application

■ *DRAFT — Requires operator review before submission*

Date: 2026-05-31 (Draft - Not Submitted)
Applicant: Alex Place / Lantern OS
Round: Human Self-Enhancement and Empowerment (HSEE)
Deadline: July 8, 2026 at 11:59 PM PT
Prize Pool: \$2-4 million
Status: DRAFT - Requires operator review and submission

APPLICATION SECTION 1: PROJECT SUMMARY (ONE PARAGRAPH)

Lantern OS is a local-first AI control plane for Windows that keeps humans organized, capable, and in control of their own files, workflows, and AI tools as artificial intelligence becomes more powerful. Unlike cloud-dependent AI services that require users to surrender their data to external servers, Lantern OS runs entirely on the user's local machine—providing RAG (Retrieval-Augmented Generation) for personal documents, MCP (Model Context Protocol) connectors with verified safety boundaries, and automation workflows that require explicit human approval before taking action. The project is built on the principle that human self-enhancement must include human agency: our 12-step convergence loop treats human review gates as non-negotiable, our ASI Arc Reactor MK1 tracks confidence with Brier-style error calibration, and our Windsurf hooks prevent automated actions without safety validation. Lantern OS is currently pre-v1.0.0 with a working garage prototype, comprehensive documentation, and a structured review methodology requiring human approval at every automated action.

APPLICATION SECTION 2: WHY THIS FITS HSEE

The HSEE round specifically funds "tools and approaches that help humans stay capable and empowered as AI advances." Lantern OS directly addresses this mission:

Human Capability Enhancement:

- Local RAG system turns scattered documents into searchable knowledge without cloud dependency
- Convergence loop methodology provides structured thinking for complex projects
- Skills library and report automation amplify individual productivity

Human Empowerment (Agency Preservation):

- Explicit human approval gates prevent autonomous AI action
- Local-first architecture keeps data under user control
- Safety hooks (Validate-DemoSafety, Validate-PromptSafety) enforce boundaries
- Evidence-gated documentation prevents claims beyond validated proof

ASI-Aligned Safety:

- Brier-calibrated confidence tracking prevents overconfidence
- ASI pattern integration as architecture references only (not capability claims)
- Strict boundaries block: unattended disk mutation, MCP execution without canary, medical claims without evidence, token/investment advice

APPLICATION SECTION 3: CURRENT STATE AND EVIDENCE

Repository Evidence

- **Primary Repo:** <https://github.com/alex-place/lantern-os>
- **Status:** Pre-v1.0.0 staging, active development
- **Structure:** 12-step convergence loop, agent fleet contracts, skills library, dashboard surfaces
- **Documentation:** Comprehensive (AGENTS.md, CONVERGENCE-LOOP.md, skill docs)

Technical Achievements

- **Convergence Loop:** 12-step validation process with explicit retire/fix/promote gates
- **Agent Fleet:** 12x3 designed review ring (36 slots) with 64-worker elastic pool
- **RAG Dollhouse:** Flat-file memory system with evidence labeling
- **ASI Arc Reactor MK1:** Confidence model with Brier-style calibration
- **Windsurf Hooks:** Safety validation (pre_run_command, pre_mcp_tool_use, pre_write_code)

Confidence Scores (Brier-Calibrated)

- Movie 1 Garage Prototype: 95%
- Movie 2 Public Platform: 68%
- Movie 3 Distributed Fleet: 32%
- Human Trial Demo Readiness: 22%

Users/Pilots

- **Current:** ~20 known users across three tiers: 5 paid (\$20/mo via Ko-fi/Patreon), 10 free-tier, 3 investor-grade (high-engagement)
- **Auth:** No OAuth yet — tracked via Ko-fi and Patreon; building toward in-app auth for v0.9.0
- **Pending:** 5 outreach sends to warm contacts for paid pilot slots; each recorded as a wallet ledger event with evidence receipt
- **Target:** 5 successful \$1000 founding seat demos to raise human trial readiness score

APPLICATION SECTION 4: USE OF FUNDS

Category	Amount	Purpose
Development Runway	\$150,000	6 months founder salary to reach v1.0.0
Infrastructure	\$25,000	Local testing hardware, CI/CD, documentation hosting
Security Audit	\$30,000	Third-party review of MCP safety boundaries
Pilot Program	\$50,000	50 paid pilot slots at \$1000 each (founding seats)
Documentation	\$20,000	Professional technical writing, tutorial videos
Community	\$15,000	Discord moderation, community events, support
Legal/Compliance	\$10,000	License normalization, terms of service, privacy review
Reserve	\$50,000	Buffer for unexpected costs
Total	\$350,000	12-month runway to sustainable revenue or next funding

Alternative smaller ask: \$100,000 for 6-month runway + 20 pilot slots

APPLICATION SECTION 5: THEORY OF CHANGE

If funded:

- 1. **Month 1-2:** Security audit + license normalization + v0.9.0 release
- 2. **Month 3-6:** 50 founding seat pilots with explicit human feedback collection
- 3. **Month 6-9:** Iterate based on pilot feedback, harden safety boundaries
- 4. **Month 9-12:** v1.0.0 release with proven human-in-the-loop operation
- 5. **Month 12+:** Sustainable revenue through service contracts or next funding round

Success metrics:

- 50 pilots completed with receipts
- Human trial demo readiness score: 80%+

- MCP canary validation: 100% pass rate
- Zero autonomous actions without human approval
- Brier-calibrated confidence tracking on all claims

Failure modes (explicit):

- Pilots reject the local-first tradeoffs (slower setup vs cloud convenience)
- Safety boundaries too restrictive for practical use
- Founder burnout (mitigated: realistic runway, 6-month checkpoint)

APPLICATION SECTION 6: WHY SFF SPECIFICALLY**Alignment with SFF mission:**

- SFF prioritizes long-term survival and flourishing of sentient life
- Lantern OS treats human agency as non-negotiable design constraint
- Local-first + explicit approval = humans remain in control as AI advances
- Evidence-gated methodology prevents overconfidence that leads to harm

Non-dilutive fit:

- Lantern OS is currently solo founder, no equity raised
- SFF non-dilutive funding preserves optionality
- Open-source release planned regardless of funding outcome

SFF mission alignment (deep):

- SFF's focus on long-term human flourishing aligns with our non-negotiable human-in-the-loop design constraints
- Evidence-gated methodology and explicit claim boundaries directly operationalize the "survival" side of SFF's mission
- Non-dilutive grant preserves founder independence for safety-first decision making

APPLICATION SECTION 7: BOUNDARIES AND LIMITATIONS**What Lantern OS is NOT:**

- Not an ASI (artificial superintelligence) - patterns are architecture references only
- Not a medical device - no health/PPE claims without separate validation
- Not a financial advice platform - no investment/token claims
- Not production-ready yet - pre-v1.0.0, explicit "garage prototype" status

What funding will NOT be used for:

- No cloud compute at scale (violates local-first principle)
- No marketing spend before product-market fit
- No hiring before pilot validation
- No claims beyond validated evidence

Explicit ask:

We seek funding to complete a rigorous, evidence-gated path to v1.0.0 with 50 human pilots. We are not claiming the solution is ready now. We are claiming the methodology (convergence loop + Brier calibration + safety hooks) produces trustworthy results worth funding.

SUBMISSION CHECKLIST

- ☐ One-paragraph summary reviewed and approved
- ☐ Use of funds breakdown confirmed realistic
- ☐ Theory of change acknowledges failure modes
- ☐ All claims matched to evidence in repo
- ☐ Rolling application form completed (<https://survivalandflourishing.fund/apply> — VERIFY URL before submitting; SFF rolling form URL may differ)
- ☐ HSEE supplemental application completed
- ☐ Operator approval for submission
- ☐ Submission receipt saved

Draft Generated: 2026-05-31

Evidence Class: repo_documentation + confidence_scores + methodology_validation

Confidence: Application draft is complete; funding outcome is uncertain (0.15-0.25 probability typical for competitive grants)

Next Action: Operator review and submission by July 8 deadline
