

Arc Reactor 12-Step Convergence Model

Generated: 2026-05-26.

Repo: `https://github.com/alex-place/lantern-os`

Purpose: connect past work, present pitch, expected future outcomes, and actual results into one repeatable COMET LEAP / Arc Reactor model.

Executive Read

Lantern OS is in a high-confidence Movie 1 garage state and a candidate Movie 2 public-platform state.

The present pitch is no longer "I have ideas." It is:

I built a local-first AI/RAG garage that turns messy repos, PDFs, art,
learning packets, and device plans into a clean cockpit, printable reports,
invoice-ready services, and store-ready prototypes.

12-Step Model

Step	Past Work	Present Pitch	Expected Future Outcome	Actual Result So Far	Confidence
1	Skeleton repo became `lantern-os` control plane	one master garage repo	clean v1 staging surface	pushed master, clean loop	95
2	COMET LEAP PDFs and 30-day art existed in source repos	printable proof packet	public/shareholder artifact set	whitepaper, ADS, reports, PDFs	86
3	RAG dollhouse was a concept	one flat memory house	retrievable knowledge spine	flat file plus 42 hashed assets	88
4	Dual boot was unclear	prep-ready Windows/NixOS path	install-ready after D: shrink	`readyForPrep=true`, install held	76
5	Wallet/cash was abstract	local ledger plus invoice	paid pilot / objection data	\$199 invoice draft, no cleared cash	58
6	Offers sprawled	existing offers only	faster cash conversations	send packet exists	64
7	Tony metaphor was verbal	Tony Garage cockpit	first-screen operator cockpit	HTML surface and launcher	84
8	Arc Reactor was metaphor	confidence power-state module	reusable readiness scoring	new skill, status JSON, report	82
9	Store lane was undefined	local/direct then Itch	first public downloadable demo	lanes mapped, no page live yet	55
10	Old repos were scattered	old workstream map	controlled intake, no fake clone claims	workstreams mapped	78
11	Archive/media wanted batching	metadata-first rights gate	safe commons library	no-download rights gate	80
12	Future fleet was speculative	server/phone/PC queue	Movie 3 distributed system	mapped, not field-proven	32

Past Work Compression

Workstream	Past State	Current Compression
COMET LEAP	PDFs, art, confidence reports scattered	reports and RAG assets
HFF scan	source repo for model artifacts	evidence source, not release target
Orchestrator	local MCP/service repo	execution plane, now clean

Workstream	Past State	Current Compression
Lantern symbolic sandbox	language/safety experiment	future symbolic/RAG lane
GameMaker repos	game/tool ideas	Itch/GameMaker candidate lane
Java legacy apps	money/bid/meal planning	product-pattern evidence
Archive/Wayback	desire for free media	metadata-first rights-gated lane
Dual boot	physical install ambition	prep script and held install boundary

Present Pitch

Use this when explaining the project:

Lantern OS is a local-first AI garage. It compresses messy knowledge into a RAG house, turns that into printable reports and learning packets, tracks cash honestly in a local wallet, and prepares Windows/NixOS/device surfaces without unsafe automation. The first public lane is local/direct plus Itch, not a premature SaaS or Steam fee.

Expected Future Outcomes

Horizon	Outcome	Evidence Needed
24 hours	5 outreach events recorded	wallet ledger rows
48 hours	first Itch-ready ZIP/HTML prototype	build folder and manifest
72 hours	dual boot install prep advanced	`readyForInstall=true` or blocker evidence
7 days	one paid pilot or rejection batch	invoice/payment/objection ledger
11 days	winning offer selected	cash sprint report update
30 days	repeatable public/demo lane	users, downloads, testimonials, installs

Actual Results Ledger

Result	Status	Evidence
Master repo created and pushed	actual	`https://github.com/alex-place/lantern-os`
Whitepaper created	actual	`reports/LANTERN-OS-WHITEPAPER-v0.1.md`
ADS architecture review created	actual	`reports/ADS-ARCHITECTURE-REVIEW-v0.1.md`
Tony Garage cockpit created	actual	`surfaces/tony-garage/index.html`
Arc Reactor skill created	actual	`skills/arc-reactor-confidence/SKILL.md`
Local wallet created	actual	`data/wallet/local-cash-wallet.json`
First invoice drafted	actual	`data/wallet/invoices/INV-COMET-LEAP-RAG-001.md`
Cleared cash	not yet	`\$0`
Dual boot prep	actual/candidate	`manifests/validation/DUAL-BOOT-PREP-LATEST.json`
Dual boot install	held	physical operator action required
Store lane	candidate	`manifests/STORE-RELEASE-LANES.md`
Itch page/build	not yet	next prototype action

Decision Table

Decision	Current Call	Why
v1.0.0 tag	hold	needs operator approval plus proof loop
Itch lane	promote next	fastest public creative/store path

Decision	Current Call	Why
Steam lane	hold	fee/review; wait for playable target
GOG lane	hold	curated DRM-free lane after traction
Cash sprint	execute	packet and invoice are ready
Dual boot	prep, not install	unallocated space not prepared
Arc Reactor	promote	useful reusable confidence module

Next Proof Actions

1. Record 5 outreach sends with ``scripts/Add-WalletLedgerEvent.ps1``.
2. Package one Itch-ready ZIP from Tony Garage or school packet.
3. Run ``dual-boot/Start-DualBootPrep.ps1`` elevated.
4. Shrink D: manually and rerun readiness.
5. Update this report with actual outcomes, not projections.
