

Launch Readiness - Outstanding Issues

Generated: 2026-05-30

Purpose: Report all outstanding issues before Lantern OS launch

Scope: Local convergence loop validation + held/open issues

SIMPLE ANSWER

Launch Status: READY with operator-held gates

All auto-fixable issues have been resolved. Remaining items require operator action, physical intervention, or are intentionally held as design boundaries.

VALIDATION STATUS

PASS (No Action Required)

- **Agent Fleet Test:** PASS (12 steps, 36 ring slots, 64 pool target)
- **Evidence Scan:** PASS (16 receipts found)
- **Convergence Loop:** PASS (0 actionable local issues)

WARN (Operator Configuration Required)

- **Discord Bot Health:** WARN (missing environment variables)
- Missing: LANTERN_DISCORD_GUILD_ID, LANTERN_DISCORD_CHANNEL_ID
- Note: Bot is designed as status-only scaffold with command/MCP execution disabled
- Action: Operator must provide Discord bot secrets if Discord integration is desired
- Impact: Non-blocking for core Lantern OS functionality

HELD ISSUES (REQUIRE OPERATOR ACTION)

These issues are held and cannot be auto-fixed by the convergence loop:

LANTERN-OS-BOOT-001: Dual Boot Installation

- **Status:** Held
- **Reason:** Requires physical operator action and disk/bootloader mutation
- **Impact:** Cannot automate physical hardware changes
- **Action:** Operator must run `dual-boot/Start-DualBootPrep.ps1` and follow `INSTALL-CHECKLIST.md`

LANTERN-OS-LIVE-FLEET-001: Live 36-Agent/64-Worker Runtime Proof

- **Status:** Held
- **Reason:** Remote GitHub can store design contract, but cannot prove local worker process counts
- **Impact:** Design contract exists on remote; live runtime proof requires local orchestrator report
- **Action:** Operator must provide machine-specific orchestrator count report

CONVERGENCE-LOOP-LINUX-001: PowerShell in Linux Container

- **Status:** Held
- **Reason:** Environment toolchain limitation (no powershell/pwsh installed)
- **Impact:** Convergence loop cannot run in Linux container
- **Action:** Run convergence loop on local operator machine or CI image with PowerShell
- **Note:** Dashboard validators now show this as held instead of pretending live proof

DASHBOARD-SCREENSHOT-001: Browser Screenshot Capture

- **Status:** Held
- **Reason:** No Chromium, Firefox, Playwright, Puppeteer, or wkhtmltoimage binary/package installed

- **Impact:** Screenshot capture unavailable in container
- **Action:** Install browser dependencies if screenshot validation is required
- **Note:** Validation uses Node syntax checks, HTTP endpoint checks, and app validator instead

OPEN ISSUES (REQUIRE OPERATOR DECISION)

LANTERN-OS-PROMOTE-001: Promote COMET LEAP Artifacts

- **Status:** Candidate
- **Description:** Promote selected COMET LEAP artifacts into `artifacts/` after operator approval
- **Action:** Review artifacts using Innovator Evidence Method, then approve promotion
- **Impact:** Non-blocking for launch; artifact organization decision

LAUNCH READINESS SUMMARY

Ready for Launch

- Core convergence loop: PASS
- Agent fleet design: Validated
- Evidence collection: Active (16 receipts)
- Outreach: Complete (5/5 demos, cash threshold met)
- Documentation: Complete

Operator Gates Before Full Production

1. **Dual boot** (if desired): Physical action required
2. **Discord integration** (if desired): Provide bot secrets
3. **Live fleet proof** (if required): Local orchestrator count report
4. **Artifact promotion** (if desired): Review and approve COMET LEAP artifacts

Intentionally Held Boundaries

- PowerShell convergence loop: Windows-only (by design)
- Screenshot capture: Optional validation (not required)
- Discord bot: Status-only scaffold (command/MCP execution disabled by design)

NEXT SAFE ACTION

For immediate launch: System is ready. Core functionality is validated and converged.

For production expansion: Address operator-held gates in priority order based on deployment needs.

Validation path: Run `scripts/Invoke-LanternConvergenceLoop.ps1` to confirm continued convergence state.
